Bitdefender Antivirus Plus 2020 is an excellent option for your PC. It comes with a number of tools that work in the background to keep you safe and consistently score very well against its competitors to identify problems and hit them down. On the anti-virus side, Bitdefender sniffs out possible threats and stores an updated list of potential threats to limit your chances of being targeted. The 2020 version of Bitdefender Antivirus Plus also adds Advanced Threat Defense, which is a behavioral detection capability to monitor active applications. And layered ransomware protection is best of its class. Additionally, the Bitdefender team is available 24/7 for support to help you get through malware-related issues. And since it comes with Bitdefender VPN and Bitdefender Safepay in the box, you'll be able to maintain your privacy and protect yourself from financial threats easily. Bitdefender plus supports up to three devices and is available for Windows 10, 8.1, 8, and Windows 7 (SP1). Unfortunately, it does not support macOS, Android, or iOS, but other versions of bitdefender products are available to support devices running the platform. Avast is one of the most famous names in antivirus protection, and with good reason. Avast Free Antivirus app is a full-service antivirus that protects users from viruses, malware, trojans, and other types of attacks. The app also causes little or no system drag, and it includes some features that you won't find in other free antivirus apps. One of the neatest features we found when testing Avast was Do Not Disturb Mode (formerly called Game Mode). This feature is designed to prevent pop-ups and other distractions while playing games or streaming, to ensure you don't have to deal with disruptions at critical times. Other notable features include a Wi-Fi Checker that scans Wi-Fi networks for malicious activity, which is a perfect complement to behavioral scans that Avast uses to detect possible suspicious behavior from installed applications, and browser extensions that warn you if you type URLs incorrectly or end up on malicious sites while surfing. Avast is available for Windows 10, 8.1, 8, 7 (SP1 or higher), Vista, and XP (SP3 or higher); macOS 10.10 (Yosemite) or later, and Android 4.1 (Jelly Bean, API 16) or higher. Antivirus apps it has a very simple interface to navigate, making it easy to control. Microsoft Windows Defender Security Center was pre-installed on Windows 8.1 and Windows 10, but unlike previous versions of Windows Defender, the latest version of the full-featured protection software and as many other free offers on the market. Microsoft Windows Defender offers real-time definition-based antivirus protection for viruses, malware, trojans, ransomware, and other threats, but also monitors behavior changes on your system to root out potential malware threats early. Additionally, Windows Defender includes a firewall to protect your system, parental controls, and scanning for USB drives, external hard drives, and disk drives. Usability is another great feature of Windows Defender. The easy-to-navigate interface makes it easy to use for even inexperienced users, but more advanced users can change the ability to scan antiviruses and firewalls, and even make changes at the registry level. One downfall for Windows Defender is the frequency with which it catches false positives. Windows Defender has been known to label JavaScript and other programming code as malicious, when in fact, it is not only benign, but included in the system, so users may want to be careful before deleting files marked as malicious. If you're looking for something easy to use to improve your computer's security, F-Secure SAFE is a good place to start. The app has an easy-to-use interface and can basically be managed (if that's your preference) once set up. F-Secure scans your machine for everything from viruses to spyware and completes automatic updates behind the scenes so you can stay on top of the latest threats without having to get too involved. The software automatically removes malware, of course, and according to the company, will remove all its functions without slowing down your machine. This includes automatic updates which will land on the platform's homepage every 3, 5, or 7 days, depending on the plan you choose. To set up parental controls to aid your children, F-Secure SAFE is also available for a range of devices, including: Windows 7 (SP1) and Mac OS X 10.12 (Sierra) or later, iOS 11 or later, and Android 5.0 or later. Unfortunately, ARM-based tablets were not supported for F-Secure SAFE at the time. F-Secure Safe also has a 30-day three-device free trial, which requires you to sign up for a site to access a free trial (but doesn't require payment information). Despite the often accusations that Kaspersky has ties to the Russian government, Kaspersky consistently gets higher scores in independent testing to fend off viruses, malware, trojans, ransomware, and all sorts of other possible threats. When we tested Kaspersky Total Security, we were not disappointed. The software continuously scans the scan machine for possible threats and work to prevent ransomware threats by identifying problems and responding accordingly. In addition, Total Security's offerings include great parental controls, password management, webcam protection, and an excellent firewall. If it is more protection than you think you need, the basic version of Kaspersky Anti-Virus is designed for simplicity, so you can set it to run and let it do just that in the background without much input in the long run. However, for minimal price increases, Kaspersky offers total security protection on up to 5 devices, and supports Windows 10, 8.7 and 8.1; macOS X 10.12 or higher, Android 4.0 or higher, and iOS 10.0 or higher. One pitfall for Kaspersky is that it can consume high amounts of system resources, so know that you will need at least 1GB of RAM and 1.5 GB of storage space on a PC or 2GB of RAM and 1.8 GB of storage space on a mac. Norton AntiVirus from Symantec has long been one of the most famous and reliable names in the antivirus market. Indeed, its market share is still large with no signs of slowing down any time soon. And that, along with its amazing features, might make it an interesting option. Norton Security Premium is a high-end antivirus offering from Symantec, designed to protect you from viruses, spyware, ransomware, and other malware threats. In addition, it comes with practical tools that protect your financial information when you enter information online and prank webcam protection, Dark Web monitoring by LifeLock, and secure VPN. Security Premium does all this on up to 10 devices and includes 100GB of secure cloud storage for backups, parental controls, firewalls, and a 100% Money-Back Guarantee. However, it is slightly more expensive than some of the offers available from other antivirus providers. But it works on Windows 7 (SP1 or later), macOS X, Android devices (including tablets), and iOS devices. Of course, if Security Premium is too rich for your liking, Norton offers several other levels of protection, each with its own features, and all supported by Norton Virus Protection Promise. There are a variety of paid options in the antivirus market that, at first flush, will seem affordable. But when you consider that they charge for one license, it may not seem like the best option. McAfee, however, is a different story. When you pay for McAfee Total Protection, you may pay a little more than you do for a single option from a rival provider. But when you sort that fee over the 10 licenses you get with the purchase, you quickly realize that you're paying a little per unit to get the option Strong. In addition, the McAfee solution includes a variety of features to keep you safe, including virus and malware protection. It also repays bloatware — or unwanted software often installed by PC vendors — from your machine and will lock your files if the device is stolen. When you surf the Web, the Web, called McAfee WebAdvisor analyzes the site where you are and notified you when you try to access risky pages. One other benefit: a password manager that helps you create secure credentials and store those credentials securely on your machine. McAfee also works on a variety of devices, including Microsoft Windows 10, 8.1, 8, and 7 (SP1), macOS X 10.12 or later, Android 4.1 or higher, and iOS 10 or later. ESET Nod32 is a powerful solution for home and office. It works with Windows 10, 8.1, 8, 7, Vista and Microsoft Home Server 2011 and there is a 30-day free trial. So if you have a need for your family computer and small office machine to stay safe, Nod32 could be the winner. Our process Our author spent 9 hours researching the most popular antivirus software on the market. Before making their final recommendations, they considered 30 different antivirus software options in total, filtered from 20 different brands and manufacturers, read more than 30 user reviews (positive and negative), and tested 4 software itself. All this research adds to the recommendations you can trust. Thanks for telling us! Tell us why! Why!
